

Global Alliance Against **Cholera** and other **Water borne diseases**

The latest news on the fight against cholera:

"To beat cholera, what is most needed is a reliable drinking water supply"

In fighting cholera, the international community usually favours responsive actions which have limited and short-term effectiveness. Such actions are often mobilised in responses to sudden epidemics, such as those in Yemen and Zimbabwe. However, there is a profound lack of evidence for how longer-term interventions, which are usually harder to achieve, can be delivered effectively.

New research addressing this gap is currently under way in the city of Uvira, South Kivu, DRC, to provide evidence for improving the supply of safe drinking water as a public health priority.

"The fight against epidemics has a bright future ahead of it..." (IN FRENCH)

This is the title of an article published in Le Parisien on October 17. Journalist Judith Bregman cites Rita Colwell and Antarpreet Jutla, members of the GAAC Advisory Council, among others.
