Scientific Publication:
Predicting the quality and quantity of household water based on tap water service

To prevent cholera and other diarrheal diseases in the Democratic Republic of the Congo, a project aiming to rehabilitate and extend the piped water infrastructure in Uvira is ongoing. A recent study evaluating the impact of the project has developed predictive models to estimate the probability of microbial contamination of household drinking water and the quantity of water used at home for domestic activities.

About cholera epidemics

No new cholera cases reported in Haiti for several months

No cases of cholera have been confirmed in Haiti since February 2019. This represents the first lull in cholera cases in the country since the bacterium was inadvertently imported nine years ago.
